Starting Virtual Environment

2024-11-11

Open a terminal in the directory of the repository. If you have not set up a virtual environment in that directory already, run

```
python3 -m venv venv
```

After that, you will need to activate the virtual environment.

```
source venv/bin/activate
```

To run the flask for testing, you will need to tell Flask how to import the project.

```
export FLASK_APP=wishlist.py
```

Once that is done, you can run it:

```
flask run
```

You can then observe the webpage at http://localhost:5000/.
